

Phacopidae indet. (TH626)

Phacopidae indet. → Phacopida → Phacopina → Phacopoidea → Phacopidae

Provenance : France, Herault, Montagnes Noires

Formation : ? Fm

Age : Devonian

Details : Given to me as a thoracopygidium. To me, it seems the matrix (which is slightly eroded on the left side of the specimen) may be hiding more (a slightly curved specimen, to be correct), so I started on a little prepping query (to find that the present exoskeleton is darn brittle; seems to have undergone some structural change, making it subject to easily detaching from the internal mould – images of prep results will be added at later date). Images on top of page 2 are of a frontal view. Specimen received as “*Phacops sp.*”. No further details were given as to the actual find site. Addition to the collection thanks to Benedikt Magrean.
