

Wenndorfia plana (Koch, 1880) (TH212b)

Wenndorfia → Phacopida → Calymenina → Calymenoidea → Homalonotidae

Provenance : Morocco; Meseta Casablanca Est, Ben Slimane

Formation : ? Fm

Age : Lower Devonian

Details : Complete specimen. Formerly placed into *Parahomalonotus*. Trilobites from the Meseta Casablanca Est all suffered from erosion (limonisation) and therefore the exoskeleton is no longer present (as it is in the case of homalonotids from Fom Zguid and Mai'der areas). Although I already had specimens of the species, this weirdly distorted one was simply a must-have for me!
