

***Dalmanites myops*** (Koenig, 1825) (TH248)

***Dalmanites*** → Phacopida → Phacopina → Dalmanitoidae → Dalmanitidae

**Provenance** : UK; England, Shropshire, Ludlow area : small stream near Vinnals Car Park in Mortimer Forrest.

**Formation** : Oakley Mynd Fm, Lower vElton Beds

**Age** : Silurian, Ludlovian Series (Ludfordian; approx. 420 MY)

**Details** : Cephalon only. Certainly, there's some ?thorax visible as well. Acquired from the personal collection of my good friend Glenn De Caluwe. Mostly an internal imprint (a thin remnant of the exoskeleton is still present, as can be seen in all images) of the cephalon...but to have is to hold (also, aha...more importantly...it adds a species to the collection), and at the price it was offered, it would've been stupid to let it lay. Well, it's been offered for sale before, and obviously I did not get it in the past, but as the collection grows, it becomes increasingly difficult to add a new species, you know?!

**Bought on** : 04/12/2016

**Bought at** : Harelbeke, CC 't Spoor

**Event** : Lithos 2016
